Studious Features Document

This is a preliminary product description. Changes and differences in the product are possible.

Studious LMS unifies all aspects of teaching and learning into a single, connected experience.
It's designed for schools and educators who want an efficient, reliable way to manage courses, assignments, communication, and attendance.

Academic Management

Studious streamlines class organization by giving teachers control over how their subjects are structured.
Each class can include multiple sections, topics, and materials, allowing teachers to tailor their teaching setup to specific needs.

Assignments form the core of the academic workflow.
Teachers can create tasks such as homework, tests, projects, or essays — each with deadlines, grading weights, and clear instructions.
This flexibility allows Studious to support both simple daily tasks and more complex, long-term coursework.

Announcements keep everyone aligned.
Teachers can post updates, reminders, or instructions that reach all students in a class instantly.
Students see new information in real time, reducing confusion and improving communication across the course.

With built-in mark schemes and grading boundaries, evaluation becomes consistent and transparent.
Teachers can define how grades are assigned and maintain fairness across classes and subjects.

File Management

The file system in Studious is built for clarity and reliability.
Every uploaded resource – from lesson plans to assignment submissions – is stored securely and connected to its relevant context.

Teachers can upload class materials directly into structured folders, keeping drafts, reference documents, and shared files neatly organized.
Students can submit their work using the same interface, making it easy to locate, review, and grade assignments without leaving the platform.

Uploads are monitored with progress indicators and automatic recovery.
If a connection drops or a file fails to upload, Studious resumes safely without losing data.
This reliability ensures that both teachers and students can focus on the content — not the process.

Scheduling and Attendance

Studious includes a built-in calendar that organizes every important event in one place.
Teachers can schedule classes, assessments, or school events and link them directly to assignments or sessions.

Students see their upcoming deadlines and class events at a glance, minimizing missed work or confusion.
Because all course activities are integrated into the same system, schedules stay accurate and automatically update across the platform.

Attendance tracking is seamlessly connected to events and classes.
Teachers can mark students as present, late, or absent in real time, while Studious records attendance history for future reference.
This integration simplifies reporting and makes participation trends easy to identify.

Communication Systems

Communication is a natural part of learning, and Studious makes it simple and direct.
Built-in messaging allows students and teachers to connect through both one-on-one and group conversations.

Mentions and notifications ensure that no message goes unnoticed — users are alerted instantly when they're tagged or when new messages arrive.
This keeps discussions relevant and responsive, even across multiple active classes.

File attachments make collaboration easy.
Teachers can share study materials or reference documents directly through messages, while students can attach files when submitting questions or seeking feedback.

Lab Chats add an advanced layer for classroom collaboration.
Each lab chat connects to a specific class and can include AI-assisted support, enabling guided discussions or structured problem-solving sessions.
